

BRAINSTORMING & IDEA PRIORITIZATION

Team ID: SWTID-2026-3238 | Project Name: PocketSmart AI | Track: AI-ML & Generative AI

1. Ideation Scope & Innovation Objectives

PocketSmart AI was conceived to bridge the gap between deterministic personal finance budgeting and unstructured creative styling decisions. Traditional e-commerce and retail aggregators encourage unconstrained shopping baskets, leading to widespread budget overruns for students, renters, and event organizers.

2. Evaluated Solution Concepts

- **Hybrid Budget & Recommendation Engine:** Algorithmic budget splitting coupled with Generative AI (LLM) recommendation cards across distinct consumer lifestyle verticals (Accepted - Core Idea).
- **Multimodal Visual Stylist:** Computer vision model analyzing user uploaded clothing images to recommend harmonizing jewelry within specific metal and budget constraints (Accepted - Multimodal Feature).
- **Full-Catalog Retail Scraper:** Aggregating 100+ stores into a local price database (Rejected - High maintenance, API deprecation risk, replaced with query-encoded outbound links).

3. Idea Prioritization Matrix

Candidate Feature Concept	Feasibility	User Impact	GenAI Value	Verdict
Hybrid Budget Splitter + Gemini LLM	5 / 5	5 / 5	5 / 5	Accepted (P0)
Multimodal Vision Outfit Stylist	4 / 5	5 / 5	5 / 5	Accepted (P0)
Smart Outbound Search Links (Amazon/IKEA)	5 / 5	4 / 5	3 / 5	Accepted (P1)
Automated Credit Checkout Bot	2 / 5	3 / 5	2 / 5	Rejected

■ Phase 1 Takeaway

- Prioritized deterministic baseline with LLM enrichment to ensure zero failure rates.
- Included computer vision capabilities to analyze user-provided outfit aesthetics.
